## Overview of Constraint Propagation 约束传播概述

### □ Regular state-space search: 常规的状态空间搜索

- can do only one thing, **search**.

只能做一件事，搜索。

### □ CSPs: 约束满足问题

- can do **search**, choose a new variable assignment from several possibilities, 能做搜索，从若干可能性中选择一个新的变量赋值，

- can also do a specific type of **inference**, called **constraint propagation**.

还能做一种特殊类型的推理，称为约束传播。

### □ Constraint Propagation: 约束传播

- uses the constraints to **reduce** *the number of legal values for a variable*, which in turn *can reduce the legal values for another variable*, and so on.

采用约束来减少一个变量的合法值的数量，相应地可以减少其它变量的合法值，以此类推。

## Overview of Constraint Propagation 约束传播概述

- Those techniques are used to modify a constraint satisfaction problem.  
这些技术被用于改变一个约束满足问题。
- More precisely, they enforce a form of **local consistency**, which are conditions related to the consistency of a group of variables and/or constraints.  
更精确地说，它们严格实施局部一致性，这种形式是一组变量和约束一致性相关的条件。
- Constraint propagation has various uses: 约束传播有各种用途：
  - 1) turns a problem into one that is equivalent but is usually simpler to solve, 将其转转化成等价但通常更易于求解的问题。
  - 2) may prove satisfiability/unsatisfiability of problems.  
可以证明问题的可满足性/不可满足性。

This always happens for some certain kinds of problems.

对于某些特定类型的问题，这种情况总是发生。

## Overview of Constraint Propagation 约束传播概述

□ There are different types of **local consistency**:

有不同类型的局部一致性:

■ Node consistency

节点一致性

■ Arc consistency

弧一致性

■ Path consistency

路径一致性

■  $k$ -consistency

$k$ 一致性

□ Most popular method is AC-3 algorithm which enforces **arc consistency**.

最流行的约束传播方法是AC-3算法，它支持弧一致性。

The name “AC-3” was used because it's the 3<sup>rd</sup> version.

## Node Consistency 节点一致性

### □ Definition 定义

A single variable (node) is node-consistent, if all the values in the variable's domain satisfy the variable's **unary constraints**.

如果变量的范畴中所有值满足变量的一元约束，则单个变量（节点）是节点一致的。

### Example:

□ in the variant of the Australia map-coloring, where South Australians (SA) dislike green, i.e.,

在简化的澳大利亚着色问题中，南澳大利亚人（SA）不喜欢绿色，即：

$$\langle (SA), SA \neq green \rangle$$

leaving SA with the reduced domain  $\{red, blue\}$ .

留给SA的为缩减范畴  $\{red, blue\}$ 。

## Arc Consistency 弧一致性

### □ Definition 定义

A variable is arc-consistent, if every value in its domain satisfies the variable's **binary constraints**.

如果范畴中的每个值满足变量的二元约束，则该变量是弧一致的。

### Example:

□ in the variant of the Australia map-coloring, the constraint  $SA \neq WA$ , we can write this constraint explicitly as,

在简化的澳大利亚着色问题中，该约束  $SA \neq WA$ ，我们可将这个约束显式地写成：

$$\langle (SA, WA), \{ (red, green), (red, blue), (green, red), \\ (green, blue), (blue, red), (blue, green) \} \rangle$$

## Arc Consistency Algorithm AC-3 弧一致性算法AC-3

**function** AC-3(*csp*) **returns** false if an inconsistency is found and true otherwise

**inputs:** *csp*, a binary CSP with components ( $X, D, C$ )

**local variables:** *queue*, a queue of arcs, initially all the arcs in *csp*

**while** *queue* is not empty **do**

$(X_i, X_j) \leftarrow \text{REMOVE-FIRST}(\text{queue})$

**if** REVISE(*csp*,  $X_i, X_j$ ) **then**

**if** size of  $D_i = 0$  **then return** *false*

**for each**  $X_k$  **in**  $X_i.\text{NEIGHBORS} - \{X_j\}$  **do**

            add  $(X_k, X_i)$  to queue

**return** *true*

---

**function** REVISE(*csp*,  $X_i, X_j$ ) **returns** true iff we revise the domain of  $X_i$

*revised*  $\leftarrow$  *false*

**for each**  $x$  **in**  $D_i$  **do**

**if** no value  $y$  in  $D_j$  allows  $(x, y)$  to satisfy the constraint between  $X_i$  and  $X_j$  **then**

            delete  $x$  from  $D_i$

*revised*  $\leftarrow$  *true*

**return** *revised*

## Path Consistency 路径一致性

### □ Definition 定义

A two-variable set  $\{X_i, X_j\}$  is path-consistent with respect to a third variable  $X_m$  if, for every assignment  $\{X_i = a, X_j = b\}$  consistent with the constraints on  $\{X_i, X_j\}$ , there is an assignment to  $X_m$  that satisfies the constraints on  $\{X_i, X_m\}$  and  $\{X_m, X_j\}$ .

对于与  $\{X_i, X_j\}$  约束一致的每个赋值  $\{X_i = a, X_j = b\}$ ，如果存在一个满足对  $\{X_i, X_m\}$  和  $\{X_m, X_j\}$  约束的  $X_m$  赋值，则二元变量集  $\{X_i, X_j\}$  对于第三个变量  $X_m$  是路径一致的。

### □ Why called path consistency

为什么称为路径一致

■ because it is looking at a path from  $X_i$  to  $X_j$  with  $X_m$  in the middle.

因为它看起来是一条从  $X_i$  到  $X_j$ 、中间为  $X_m$  的路径。

## $k$ -Consistency $k$ 一致性

### □ Definition 定义

A CSP is  $k$ -consistent if, for any set of  $k - 1$  variables and for any consistent assignment to those variables, a consistent value can always be assigned to any  $k^{\text{th}}$  variable.

对于任意  $k - 1$  个变量的集合以及对于这些变量的任意一致性赋值，如果某个一致性值总是能够被赋值于任意第  $k$  个变量，则该CSP是  $k$ 一致性的。

### □ The notion of $k$ -consistency is the stronger forms of propagation.

$k$ 一致性的概念更强的传播形式。

### □ Features of $k$ -consistency $k$ 一致性的特点

- $k = 1$ : same as *node consistency*.      $k=1$ : 等同于节点一致性
- $k = 2$ : same as *arc consistency*.      $k=2$ : 等同于弧一致性
- $k = 3$ : same as *path consistency*.      $k=3$ : 等同于路径一致性

## Example: Sudoku 数独

- Sudoku is a logic based, combinatorial number placement puzzle.

数独是一种基于逻辑的组合数填空难题。

- The objective is to fill a  $9 \times 9$  grid with digits, so that each column, each row, and each of the nine  $3 \times 3$  sub-grids that compose the grid contains all of the digits from 1 to 9.

其目的是用数字填满 $9 \times 9$ 个网格，使得每一行、每一列、以及9个 $3 \times 3$ 的子网格的每一个都包含从1到9的所有数字。

### History

- Number puzzles appeared in French in late 19th century.  
19世纪后叶，数字谜题出现在法国
- It was introduced by Japan in April 1984.  
日本于1984年4月引入该数字谜题。
- London began featuring Sudoku in 2004.  
伦敦于2004年开始关注数独。

## Example: Sudoku 数独

□ Variables: 变量:

$A_1, A_2, \dots, A_9$

$B_1, B_2, \dots, B_9$

...

$I_1, I_2, \dots, I_9$

□ Domains: 范畴:

$\{1, 2, \dots, 9\}$

□ Constraints: 约束:

row : 行:  $Alldiff(A_1, A_2, \dots, A_9), \dots, Alldiff(I_1, I_2, \dots, I_9)$

column : 列:  $Alldiff(A_1, B_1, \dots, I_1), \dots, Alldiff(A_9, B_9, \dots, I_9)$

region : 区域:  $Alldiff(A_1, A_2, A_3, \dots, C_3), \dots, Alldiff(G_7, G_8, G_9, \dots, I_9)$

	1	2	3	4	5	6	7	8	9
A			3		2		6
